INTRODUCING ICEWARP VERSION 11.0

IceWarp 11 was designed with our customers and the demands of the future in mind. Carrying on the tradition of keeping organizations of all sizes connected easily, version 11 takes some of IceWarp most popular features and makes them even better.

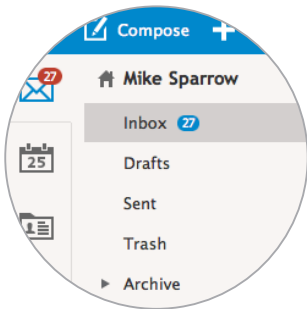

www.icewarp.com

Refreshed Login Screen

The new login provides easy-to-follow tips on the full range of collaboration tools in IceWarp. Complete with your company's logos, colors and banners, Twitter and Facebook links.

Modern Design Inside

A stunning new visual and functional concept can be found inside and out. The redesign is inspired by a modern visual language with flat icons, soft colors, larger type and simplified layout.

Hi-Resolution Graphics

Graphics elements are able to uniquely adjust in size to various pixel densities of modern displays so that the UI is always looking ultra sharp, independent of screen resolution.

Touch Screen Friendly

Dedicated radiator buttons allow you to “right-click” while using touch devices, such as tablets and hybrid notebooks.

Desktop Notifications

WebClient can show notifications about new emails, chats and other others actions on your desktop computer. Works on Windows and Mac with Chrome, Safari and Firefox.

Updated Mobile Interface

We didn't forget about smartphones either. The WebClient interface for mobile browsers sports new, modern visuals.

Dynamic Central Dock

The dock is now at the bottom of the screen just like in Windows or Mac and not only holds minimized windows, but also notifies of new posts to docked conversations.

Cleaner Compose Window

Always ready to send with a much more streamlined email composer. Less used features are available under pop-out panels.

Navigation Tabs

Tabbed access to Mail, Calendar, Contacts, Documents, Tasks, Notes and Trash folders allows to drag & drop items between these categories e. g. to turn emails into appointments.

Better-Integrated WebIM

Icons for WebIM, WebPhone and Meeting features are within reach from the toolbar and indicate the online status or ongoing activity at a glance.

Search Wizard

We didn't forget about smartphones either. The WebClient interface for mobile browsers sports new, modern visuals.

Dropbox Integration

The dock is now at the bottom of the screen just like in Windows or Mac and not only holds minimized windows, but also notifies of new posts to docked conversations.

Photo Preview

Attached photos and images can now be previewed without downloading them to disk. A browsable "light room" opens across the window, with the option of full screen if needed.

Built for BYOD

Version 11 contains more mobile management options for end users. The Mobile Devices dialog lists all connected Exchange ActiveSync clients, letting users rename, configure or remotely wipe their devices.

Horizontal Preview

The new view type lets you see everything you need from an email without opening it. The email viewer itself can be cleaner and scrolled down completely out of the way.

Faster Way to Tags

Tags are promoted to the first screen upon opening an item and can be managed from there easily, as the dialog is more intuitive than before.

Documents in Tablet Interface

When you login through the tablet interface you can see a new documents tab. This tab lets you browse and download all your documents. It allows you to upload new files as well.

Safer Aliases

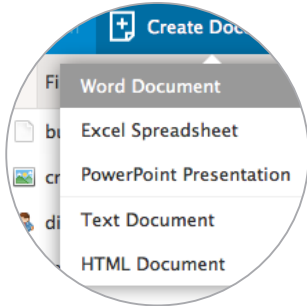

We have introduced a new email verification system, which allows users to create their own From: addresses for use in outgoing email.

User Profiles

Users can customize their personal contact information from My Details menu under their photo. This information then becomes visible to others in Global Address List.

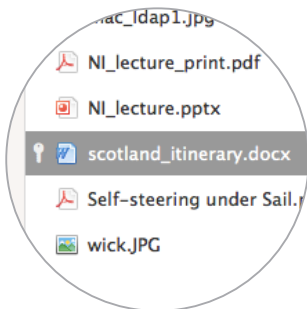

Accessibility Mode

For vision-impaired users, it is possible to switch the WebClient Tablet's skin to Accessibility Mode. This enables a high contrast color scheme and displays text descriptions instead of icons.

Create, Edit and Revise Documents

New files can be started directly from WebClient and saved to Files folder. Documents can be renamed directly in the list. Plain text and rich text documents can be created and edited within the browser.

Team Editing

If you want to be the only person who can edit a document, you can simply “lock” it. Other users with access to the document will see the lock icon activated by you and will not be able to open it.

Automatic Revision Control

Every document now has a complete revision history. You can go back to an earlier version if needed. Revisions can be added automatically on each open and change, or uploaded manually.

Notify of Changes

Users can set up email notifications for when a document is being changed. Even for people outside your team who don't have permission to edit the document but might still find it of interest.

Compatible with MS Office and Open Office

Editing on multiple computers in multiple fashions has never been this easy before. Office documents can be opened in MS Office or Open Office without downloading them, and then uploaded back when closed.

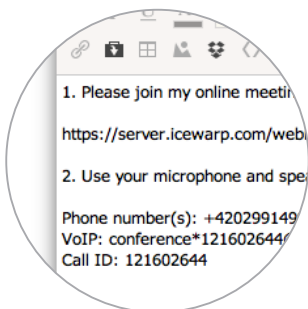

Conference Calls + Chat + Screen Sharing

In the same vein as WebEx or GoToMeeting, users will now be able to schedule online conference calls and invite attendees, share a screen, chat and pass keyboard and mouse control to others on the call.

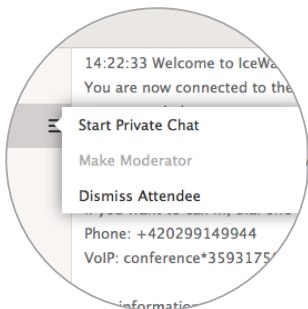

Connect with Others

External contacts can connect to a meeting too. They receive a onetime web access, or can be invited to join the screen sharing, or can call to provided dial-in numbers.

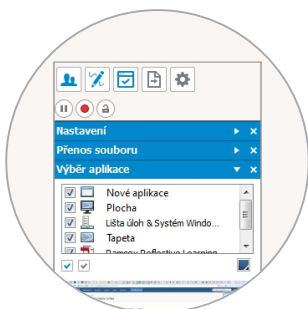

Schedule with Ease

Online meetings can be started immediately or scheduled for a later time. Participants are invited by email similar to scheduling an appointment with possibility to accept or decline the invitation.

Flexible Meeting Moderation

Organizer can start screen sharing and record audio of the conference. A moderator can share his screen, mute, invite or dismiss participants. Attendees can see others on the call and chat together or in private.

Screen Sharing (One-to-one, One-to-many)

Screen sharing is the best way to share any screen content or application over the Internet with up to 25 participants at once. Present meeting notes, give a presentation or provide remote support.

Outlook 2013 Support

Outlook 2013 can be set up instantly without installing anything, simply by configuring it for an Exchange ActiveSync service, much like with a smartphone.

iOS Secure Messaging

Full S/MIME support allows for email encryption and signing with personal certificates. Users install the private certificate on their devices, the recipient's public certificate is retrieved from GAL.

Tasks & Notes for Android

The app solves Android's lack of official support for Tasks and Notes and keeps the WebClient or Outlook in sync with your Android device, providing for remote management of Notes, Tasks and checklists.

Passcode & Encryption Policies

New in-depth security policies keep device passcodes strong. There are also new security policies that make encryption of devices and removable storage mandatory to further protect your organization's data.

Flags Synchronization

Two-way synchronization of replied, forwarded and follow-up flags allows you to keep email organized on all your devices at all times.

iOS 7 Notes

Starting with iOS 7, iPhone and iPad users now will be able to keep their Notes sync up between their device, Microsoft Outlook and WebClient, with no external application needed.

Feature-Control Policies

New policies let you control features devices can use, in classified and other controlled environments. In addition to disabling camera or Wi-Fi, other apps like built-in browser or consumer email can be disabled.

Server-Side Search

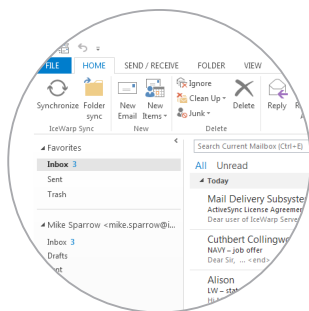

Server-side search allows look-up of emails older than those synchronized to a mobile device. The search then returns all results from the user's Archive folder without the age limitation.

Policies for Increased

New policies help minimize the amount of company data present on devices, increasing overall security. Admins can disable HTML emails, attachments, or restrict the maximum email/calendar age.

Folder Management

Users can create, move, rename and delete folders right from supported devices. The whole folder structure can be freely manipulated, even when the mobile OS is lacking the appropriate functions.

Integrated to Ribbon

Outlook Sync is now fully integrated into Outlook 2013 interface and available under its own IceWarp Sync tab. Also supplied is a new set of large icons to visually blend into Outlook with a native look and feel.

Personalized Read Receipts

Users can now easily customize the read receipts text as well as auto responder text for a bit more personalization in the workspace, such as adding a link to their social network profile.

Priority Sync

Users can assign Priority sync to folders they are most concerned about and set their synchronization period independently. This way email pushed to mobile devices or shared with others is always current.

Global Address Book

The Global Address List will now show in Outlook as e-mail Address Book. Outlook will autosuggest addresses, search for message recipients and retrieve users' availability for meetings.

Latest spamassassin

IceWarp's Anti-Spam has been improved with the latest version of spamassassin, as well new repositories, parsers and rules updated daily. This ensures better performance and lower maintenance.

Extension Filters in Archives

In the Anti-Virus file extension settings, administrators can specify to Apply extension filters to archives, eliminating executable malware hidden inside ZIP files attached to emails, uploaded to GroupWare or FTP.

Active Directory to vCard

All users' contact details can be retrieved from AD, to be shown in console's vCard, synced to GAL and available to users in their WebClient user profile (My Details). User details to retrieve can be customized.

VoIP - Online Conferencing

The new service for online meetings called Online Conferencing multiplexes and streams audio calls, and services the private and group chats. It has its own entry in Services, its virtual Device, and its own Log.

Linux 64-Bit Version

The Linux version of IceWarp is being released for the first time as an x64 application. There are numerous other optimizations that make the Linux version a strong contender to Windows-based servers.

Debian and Ubuntu Support

IceWarp for Debian 6 and Debian 7 is now official. We have also added builds for Ubuntu 10.04 LTS (Long Time Support) and 12.04 LTS, increasing the supported number of Linux systems to 11.
